The Hullar and Anastasio paper is very interesting. However, they are missing a key reference to a paper that contained results that are directly relevant to their study, and which showed the same result that they observed-namely the OH together with OM were an important source of peroxide. Zhou et al. 2008. Geophys. res. Lett. (doi:10.1029/2008GL035418) showed that the OH radical (as formed from nitrate) along with organic matter were an important source of peroxide in newly formed marine aerosol extracts.
