Interactive comment on “Technical Note: The horizontal scale-dependence of the cloud overlap parameter alpha” by I. Astin and L. Di Girolamo

Anonymous Referee #1

Received and published: 14 May 2014

This note discusses a potentially important problem for cloud modeling, namely, that the degree of vertical overlap of clouds depends on the horizontal averaging scale. This could cause problems when, for instance, a model's horizontal grid spacing is changed.

The problem is nicely illustrated with idealized examples.

Major Comments:

The note up to Eq. (12) seemed clear to me. But Eqs. (12-15) and (19-21) could use some extra explanation or the presentation of intermediate mathematical steps.

For Eq. (12), I'd note that $c_a = c_b = \mu$ and that $<c_a'^2> = \sigma$.

For Eq. (13), I'd provide an extra step in the derivation and note that $\sigma$ and $\mu$ retain their definitions from Eq. (12) (if that's true).

For Eq. (14), I'd clarify how this equation depends on $c_{\text{max}}$ in Eq. (11) and what the value of $c_{\text{max}}$ is.

In Eq. (15), what are ‘a’ and ‘b’? Are they related to the two altitude levels ‘a’ and ‘b’ (see Eq. 1)? If not, can you change the variable names? In addition, can you write $\mu$ and $\sigma$ in terms of ‘a’ and ‘b’ for the convenience of readers?

line 21, p. 9807: What is $c_{\text{a}}$ and how is it different than $c_{\text{a}}$ and $C_{\text{a}}$?

I don’t understand the derivation of Eqs. (19) and (20).

Minor Comments:

line 17, p. 9804: “data is discarded” should be “data are discarded”.

line 19, p. 9804: This would be somewhat redundant, but I would replace “two adjacent grid boxes” with “two horizontally adjacent grid boxes”.

line 25, p. 9807: Replace “aproach” with “approach”.
