Response to Reviewer #2's comments on the paper entitled “Natural or anthropogenic? On the origin of atmospheric sulfate deposition in the Andes of southeastern Ecuador”

Please find here below our response to referee #2’s comments. The text is also available as a supplement file (pdf) with different color keys for comments and answers to improve readability. Please note that “C” stands for comment and “A” for answer.

General comment:

C: The manuscript describes sources of sulfate deposition from five years of precipitation measurements at two mountain sites in south eastern Ecuador. The authors have brought together meteorological measurements, emissions estimates, and satellite data to compare to precipitation sulfate measurements in order to evaluate the impact of various S sources on remote mountain regions. This is a novel approach to a difficult problem; the identification of acidic inputs in sensitive remote alpine regions in Ecuador enhances the ability of researchers to apply similar techniques in mountain regions around the globe. Information on long-term changes in S inputs to remote alpine regions can be used to evaluate changes in anthropogenic versus natural emissions which in turn can be used to inform policy decisions. The manuscript was a pleasure to read. It is well constructed and aside from a few minor errors, typos and small grammatical mistakes that are described below, it is well written. The authors have been thorough in their description and the interpretation of the data is well argued and reasonably supported. Sufficient information is provided on the types of analysis and the potential pitfalls associated with the various data sets. The tables and figures are clear and appropriate.

A: We sincerely thank the reviewer for his comprehensive and positive general comments, the valuable recommendations and the very accurate assessment of the text, figures and tables.

We will consider all reviewer's recommendations as listed below in detail.

Specific suggestions:

C: Abstract: Line 11: been instead of being Line 14: conditions affects the origin...

A: We will consider these recommendations. Thank you.

C: Page 2: Line 8: effects were found to be more serious Line 10: only a few studies Line 31: contribute larger amounts

A: We will consider these recommendations.

C: Page 3: Line 7: surveys in some (duplicate word) Line 11: local sources such as Line 12: deposition Line 19: were given special attention

A: We will consider these recommendations.

C: Page 4: Line 1: emissions as accurately as possible Line 6: to determine sulfate deposition Line 17: It is unclear what is meant by “anthropogenic replacement systems” here. Please clarify. Line 23: are only a few sources

A: We will apply the changes suggested for lines 1, 6, and 23. In line 17, by “anthropogenic replacement systems” we refer to pasture areas on the bordering hill-slopes of the Reserva Biológica San Francisco (RBSF). Here, forest cover was converted to pastures for cattle ranching activities; we will clarify this in the text as well.

C: Page 5: Line 14: define MS (meteorological stations?). This acronym is described in a figure caption but it should be spelled out the first time it is used in the text. Line 18 and throughout the manuscript from this point forward SO2 – the 2 needs to be a subscript. Line 24: and transport to the observation sites.

A: We will consider these recommendations.
that fires and volcanic emissions

We will consider these recommendations.

pH

We will consider these recommendations.

Before proceeding with highest precipitation and OP inputs observation period at around spell out what the acronym MAD means here. both types of precipitation input

We will consider these recommendations.

highly loaded rain and OP – specify what the rain and OP is loaded with – ions?, sulfate? generally higher when from not form

Besides this there airstreams dark grey bars. Contrary to this, during wind conditions...(light grey) Note that the light and dark grey description doesn’t match the graphic.

Changes will be applied. You are right, I made a mistake in the text. The graphic is correct. I will switch “dark gray” and “light gray” in the text.

small rather than light showed the same peak coincidences at el Tiro contributes are also higher than in rain here. of the type of precipitation

We will consider these recommendations.

loadings in factors 1, 2, 4 and 5? Is the lack of factor 1 here a typo? If not, explain. sources did not play substantial

Thanks. Yes it is a typo. It should be “loadings in factors 1, 4 and 5”. I actually realized that there was also an error in table 4. The last two row names in a) should be “Cerro del C. OP SO$_4^{2-}$” and “Cerro del C. rain SO$_4^{2-}$”. In b) it should be “ El Tiro OP SO$_4^{2-}$” and “El Tiro rain SO$_4^{2-}$”. Changes will be applied to lines 25 and 26.

north and
