We thank the reviewer for her/his positive assessment. We have modified the text to clarify the mentioned points.

**Line 190: I do not understand the meaning of "these four data points". It is not explained anywhere in this section.**

This analysis resulted in four data points, $\Delta X$ vs. $\Delta CO$, for characterizing source emission profiles. A linear least-square regression analysis was then applied to these four data points, with the slope of the regression line describing the molar emission ratio (ER) of the species X relative to CO, $ER_{X/CO}$, in ppbV ppmV$^{-1}$.

was modified to read:

This analysis was performed for each of the fire overflights resulting in four data points, $\Delta X$ vs. $\Delta CO$, for source emission characterization. A linear least-square regression analysis was then applied to these four data points, with the slope of the regression line describing the molar emission ratio (ER) of the species X relative to CO, $ER_{X/CO}$, in ppbV ppmV$^{-1}$.

**Line 199: The term delta CO-source is not defined. It is central to the eqn and must be defined.**

The dilution-corrected molar excess mixing ratio of a species X, $\Delta_{dil}X$ (in ppbV), at a downwind location was calculated from the locally observed $\Delta X$ and $\Delta CO$ using the following equation:

was modified to read:

The dilution-corrected molar excess mixing ratio of a species X, $\Delta_{dil}X$ (in ppbV), at a downwind location was calculated from the excess mixing ratio of CO observed at the fire source, $\Delta CO_{source}$, and the locally observed $\Delta X$ and $\Delta CO$ using the following equation:

**Line 223: The box model is not fully explained. The authors need to include more information on how dilution is incorporated.**

The following text was added:

The model calculates dilution from the simple equation

$$\frac{dX}{dt} = -k_{dil}(X(t) - \bar{X}_{background})$$

where $k_{dil}$ represents the dilution rate coefficient obtained from the decrease of $\Delta CO$ versus plume travel time. $k_{dil}$ was calculated in 285 s time bins (equivalent to 1 km distance bins). More information on the UWCM and the underlying theory can be found in Dillon et al. (2002), Wolfe and Thornton (2011) and Wolfe et al. (2012).
