Interactive comment on “Medium-range mid-tropospheric transport of ozone and precursors over Africa: two numerical case-studies in dry and wet seasons” by B. Sauvage et al.

Anonymous Referee #2

Received and published: 7 May 2007

The author’s objective in writing this manuscript is to explain the transport characteristics which cause ozone maxima in the MOZAIC profiles above Lagos, Nigeria in both dry and wet seasons. They have done a very good job of explaining these maxima through use of a mesoscale dynamical model and associated back trajectories. It appears that both local pollution and regional transport of biomass burning pollution are responsible for the observed ozone and CO peaks. Using the trajectories and model wind, potential temperature, and humidity fields, the authors diagnose the transport dynamics for each peak on the ozone profiles. The model performed better in comparison
with measured profiles (at Lagos) of winds and temperatures in the dry season then in
the wet season. However, regionally the model appeared to generate reasonable pat-
terns. Given the paucity of observed data in this region of the world, I am surprised that
the model did as well as it did. I would recommend publication of the paper following a
few minor improvements which are listed below.

A couple of general comments concerning the text and figures: I thought that issues
concerning English expression were to be caught in the first phase of the ACPD review
process. They do not appear to have been. There are several locations (listed below)
where the English wording should be improved. Please make the figures larger such
that are more easily readable.

p. 4675: An explanation of the various flow regimes is given here. However, I would
recommend that a map be included which shows these flow regimes in schematic form.
This would help the reader in interpreting the text.

line 5: radiation instead of radiations

p. 4676: lines 9-11: point out that answering this question is the main objective of this
paper.

p. 4679, line 17: superimposed on

p. 4680, line 7: cluster instead of bunch

p. 4681, line 4: a meridional instead of meridian; line 26: cluster instead of bunch

p. 4682, line 3: reproducibility instead of reproductibility

p. 4683, line 9: is used to obtain the precise history; line 26: sensitivity instead of
sensibility

p. 4684, line 2: I would think that this line should read "the model severely underesti-
mates wind speed..."

p. 4686, line 10: carbon instead of carbone; line 24: southern instead of sourthern
