A very interesting paper.

Is it possible to easy access to flux study with your model? May you have results (maxima or averages) about dust fluxes (i.e. g/m²/s) in the main desert sources areas during SDS events, but also during the moderate dust storms? It is - at least - for me (with dust concentrations of course) a tool to compare the different models.

Thank you.

NB: I suppose that the web link in the paper, for NIES, is http://www-lidar.nies.go.jp/
