Kjaergaard did not calculate v=6 to be larger than v=5 as I stated in the response to the first coment. That calculation was done by X. Huang. Kjaergaard calculated that there were discrepancies in the oscillator strengths due to a cancellation effect of the dipoles but the relative magnitude of successive overtones was not reversed. My appologies to H. Kjaergaard for the mistake and the belated correction. Unfortunately, finishing my Ph.D. has not made my list of things to do any shorter.
