Interactive comment on “Vertical profile of peroxyacetyl nitrate (PAN) from MIPAS-STR measurements over Brazil in February 2005 and the role of PAN in the UT tropical NO\textsubscript{y} partitioning” by C. Keim et al.

C. Keim et al.

Received and published: 16 April 2008

Since the submission of the manuscript, we retrieved the profile of HO2NO2 from the MIPAS-STR-spectra as described in [Stiller et al., J. Geophys. Res., doi:10.1029/2006JD007212, 2007]. Resulting maximum tropospheric HO2NO2 values are 0.05 ppbv (at 10 km altitude). Thus, additional consideration of HO2NO2 in the NO\textsubscript{y} budget (Fig. 13) does not resolve the discrepancy between the in situ measured NO\textsubscript{y} amount and the sum of all individual constituents of NO\textsubscript{y}. For the revised version, we will change the related paragraphs and Figures.
