Received and published: 10 August 2009

The authors would like to thank both Anonymous Referees for their very helpful comments!

In the following a list of the main changes that will be made in the revised manuscript is given:

- an altitude-time cross section of original ECMWF Kelvin wave zonal wind variances will be added and discussed

• some more discussion will be added in Sect. 2 (about longitudinal variations in the sources and propagation conditions, etc.)

• spectra for a single time window will be added to investigate the effect of the delayed wave dissipation in the GROGRAT simulations

• it will be clearly stated that the minimum altitude where Kelvin waves dominate the spectrum is dependent on the parameter considered

• it will be checked whether parts of Figs. 10–15 should be removed

Also the other comments will be treated in detail. A detailed point by point response will be given together with the revised manuscript.

Best regards,
Manfred Ern
