Dear Dr. Merched Azzi Thank you so much for your evaluation and very helpful suggestions. We are indeed doing more thorough analyses on inorganic and organic N components and their isotopes (only $\delta^{15}$N, $\delta^{18}$O, $\Delta^{17}$O of nitrate so far) in a wider range of PM2.5 samples collected at Beijing area. There have been several works on carbon isotopes ($\delta^{13}$C and or $\Delta^{14}$C) of TC, EC, organic C compounds of aerosols in China, which can be involved when necessary to improve N source apportionment.
