Comments on Liu 2018 Antarctica aerosol

General Comments

This paper covers a year’s worth of organic aerosol measurements in a region that is rarely sampled and sheds valuable insight into the chemical composition of Antarctic aerosol. The paper is well-written and the figures and tables are clear and legible. Aside from minor corrections and qualifications, I have just one concern with the current form of the manuscript. The authors claim a connection between carboxylic acid variability and downwelling radiation that, for reasons I describe below, is misleading. Unless the authors can clarify and justify this correlation, I would recommend that the
discussion of that connection be omitted. Otherwise the paper needs only minor re-
vision before it is suitable for publication. Given that this aspect may take more work
to revise, I am selecting major revision in the online evaluation. However, the changes
should not be overly burdensome.

Specific Comments

Pg 2 line 22: please give a value range for the “high fraction” of OH observed previously

Pg 2 line 25: similarly, what range of ON mass fractions have been observed? Is it a
minor component, or major? Or highly variable?

Pg 5 line 5: I don’t see SLCE defined before it is use as an abbreviation

Pg 7 line 4: I’m unclear as to what the “factors identified as urban combustion emis-
sions” is that correlates to the FFC factor. Do the authors mean “factor spectra”? Like,
other FTIR PMF spectra? Please clarify.

Figure 6 and discussion on page 8 (and in conclusion/abstract): Drawing any rela-
tionship about photochemistry from the correlation between M&S carboxylic acid and
DWR is misleading. The observed correlation, as I understand it, is simply the corre-
lation between the M&S factor strength and down-welling radiation time series, since
the carboxylic acid attributed to the M&S factor is always the same fraction of the factor
(given in Fig 4), and so varies only as the strength of that factor. The same correla-
tion coefficient (r) would be obtained for any of the functional groups present in the
M&S factor and for the factor as a whole, as correlation coefficients do not change
with addition/subtraction or multiplication by constants to the vectors being compare.
Further, the downwelling radiation is varying only because of the season change (Fig
1) and the strength of the M&S factor, associated with the Adelie penguins, is also
due to seasonal migration, so the observed correlation to downwelling is really just a
product of the M&S factor and downwelling both having season characteristics. The
authors would have to do more analysis and include other metrics to state that there
was any connection to photochemistry evident in this data set. I would need to see this suggestion/discussion removed before recommending publication.

Technical Corrections

There are extra spaces after most of the references when they end a sentence. Please edit the Latex code that is causing that.

In a number of cases there are spaces between value and % symbols, beginning in the abstract.

Pg 2 Line 1: insert a space between In and 1966
Pg 2 line 18: omit comma after “found that”
