S1: Calculation of Angstrom exponent of semi-volatile aerosol absorption/scattering

As mentioned in the original manuscript, ‘wet’ sample always represents ambient aerosol and ‘dry’ sample represents ambient air passing through TDD. For better clarification, how we computed AAE and SAE, we provide below text as additional supplementary material.

The semi-volatile aerosol fraction contribution to ambient aerosol properties were measured through the difference between wet and dry aerosol properties.

\[ SVM = WAM - DAM \]

Where,
\[ SVM = \text{Semi-Volatile aerosol fraction contribution which can be number, scattering or absorption} \]
\[ WAM = \text{Wet aerosol property which is ambient aerosol number, scattering or absorption} \]
\[ DAM = \text{Dry aerosol property which is TDD derived aerosol number, scattering or absorption at different TDD set temperatures} \]

For example semi-volatile aerosol fraction absorption contribution was calculated from the below formula.

\[ SVM_{abs,\lambda} = WAM_{abs,\lambda} - DAM_{abs,\lambda} \]

Where,
\[ SVM_{abs,\lambda} = \text{Semi-Volatile aerosol fraction absorption at wavelength } \lambda \]
\[ WAM_{abs,\lambda} = \text{Wet aerosol absorption at wavelength } \lambda \]
\[ DAM_{abs,\lambda} = \text{Dry aerosol absorption at wavelength } \lambda \]

Wet and dry aerosol absorption were measured using identical aethalometers (AE-33) at seven different wavelengths. We derived semi-volatile aerosol fraction absorption at seven different wavelengths from above equation and aethalometer’s (wet and dry) absorption data.

\[ AE = - \frac{\log E_{\lambda_1}}{\log \frac{\lambda_2}{\lambda_1}} \]

\[ AE = \text{Angstrom Exponent} \]
\[ E_{\lambda_1} = \text{Absorption/Scattering/Extinction coefficient at wavelength } \lambda_1 \]
\[ E_{\lambda_2} = \text{Absorption/Scattering/Extinction coefficient at wavelength } \lambda_2 \]

From the above equation we derived wet, dry and semi-volatile aerosol fraction absorption/scattering angstrom exponent.
S2. Calculation of Single Scattering Albedo (SSA)

There is a constant fraction contribution of semi-volatile aerosol physical-optical properties in our experiments (figure 3, 7 and 10). Linear regression and correlation coefficients indicated that the average absorption and scattering losses at each temperature were almost consistent for a particular TDD set temperature with very little variation in the slope. Taking this into account, the linear slopes were used to derive the semi-volatile fraction contribution for wet (ambient) aerosol absorption and scattering. Same fractions were used to understand semi-volatile aerosol fraction contribution for given wet aerosols SSA. This will give important information on the nature of semi-volatile aerosol contribution to aerosol radiative forcing.

Single scattering albedo (SSA) is defined as the ratio of scattering to total extinction due to atmospheric aerosols as suggested in the equation below.

\[
SSA = \frac{\text{Scattering}}{(\text{Scattering} + \text{Absorption})}
\]  

(1)

Assuming wet aerosol SSA = 0.9 and scattering = 100, we derived the absorption using the above equation;

\[
0.9 = \frac{100}{(\text{Absorption} + 100)}
\]

(2)

=> \[
\text{Absorption} = \frac{100 - 90}{0.9}
\]

(3)

So, wet aerosol absorption = 11.11

Similarly, when we consider wet aerosol SSA = 0.95 and scattering = 100, absorption = 5.2

The semi-volatile aerosol fraction contribution derived from regression slopes were used in below equations.

\[
\text{Semi} - \text{volatile aerosol scattering} = \text{wet aerosol scattering} \times \left(\% \text{ contribution of semi} - \text{volatile}\right)
\]

(4)
Semi-volatile aerosol absorption = wet aerosol absorption \times 
\left( \frac{\text{% contribution of semi-volatile}}{100} \right) \quad (5)

For wet aerosols scattering = 100 and absorption = 11.11

Semi-volatile aerosol scattering from eqn. 4 = 24.58 (Table S1 Column 3, given below) (for TDD set temperature 50°C while absorption = ((11.11 \times 17)/100)) (Table S1 Column 2, given below)

\[ SSA = \frac{\text{Semi-volatile aerosol scattering}}{\text{Semi-volatile aerosol scattering} + \text{Semi-volatile aerosol absorption}} \quad (6) \]

Semi-volatile SSA at 50°C = \frac{24.58}{24.58+2.73} = 0.861595 (Table S1 Column 4) (for TDD set temperature 50°C)

Where:

- Scattering (%) = Loss of scattering at \( T_i \)
- Absorption (%) = Loss of absorption at \( T_i \)
- \( T_i = \) TDD set temperature
