**Figure S1.** (a) The comparison of noontime PBLHs derived from MPL and radiosonde at Beijing. (b) The comparison of noontime PBLHs derived from CALIPSO and MPL at Beijing. (c) The comparison of noontime PBLHs derived from CALIPSO and MPL at Hong Kong. This comparison is adapted from Su et al. (2017). (d) The comparison of noontime PBLHs derived from CALIPSO and MERRA.
Figure S2. Spatial distributions of climatological PM$_{2.5}$ for (a) JJA and (b) DJF during the period 2012–2017.

Spatial distributions of climatological PM$_{10}$ for (c) JJA and (d) DJF. Spatial distributions of climatological SO$_2$ for (e) JJA and (f) DJF. Spatial distributions of climatological NO$_2$ for (g) JJA and (h) DJF. Spatial distributions of climatological CO for (i) JJA and (j) DJF. Spatial distributions of climatological O$_3$ for (k) JJA and (l) DJF.
Figure S3. The relationship between PBLH and noontime PM$_{10}$ over (a) NCP, (b) PRD, (c) YRD, and (d) NEC.
Figure S4. Relationships between MPL-derived PBLH and PM$_{2.5}$/PM$_{10}$/SO$_2$/NO$_2$/CO/O$_3$ over Beijing. Correlation coefficients (R) are shown in red in each panel. We use only data acquired during 1000–1500 local time, when the PBL is well developed. The relationships between CALIPSO-derived PBLH and PM/SO$_2$/NO$_2$/CO (presented in Figure 3 and Figure 10) are similar to the results derived from MPLs, including the unique PBLH-O$_3$ relationship.
Figure S5. Spatial distributions of (a) correlation coefficients and (b) slopes (unit: µg m⁻³ km⁻¹) of the relationship between CALIPSO PBLH and PM₂.5. Spatial distributions of the slopes of the PBLH-PM₂.5 relationships for (c) MAM, (d) JJA, (e) SON, and (f) DJF. Dots marked with black circles indicate where the relationship between PM₂.5 and PBLH is statistically significant at the 95% confidence level. Mean values and standard deviations are shown in red at the bottom of each panel.
Figure S6. Stratification by annual pollution levels. The correlation coefficients (R) and slopes between PBLH and noontime PM$_{2.5}$ for polluted regions (a-b) (annual mean PM$_{2.5}$>40 ug m$^{-3}$) and clean regions (d-e) (annual mean PM$_{2.5}$<40 ug m$^{-3}$). The correlation coefficients (R) between PBLH and PM$_{2.5}$/AOD for polluted regions (c) and clean regions (f). Noted the PBLH-PM correlations are much stronger for polluted regions. After normalizing PM$_{2.5}$ by AOD, the correlations are much stronger for most stations, especially for those over clean region.
Figure S7. (a) Spatial distribution of correlation coefficients (R) for the WS-PBLH relationship. (b) Spatial distribution of correlation coefficients (R) for the VR-PM$_{2.5}$ relationship.
Figure S8. The relationship between noontime PM$_{2.5}$ and ventilation rate over (a) the NCP, (b) PRD, (c) YRD, and (d) NEC.
Figure S9. The relationship between hourly PM$_{2.5}$ and PBLH for (a) absorbing aerosols and (b) weak-absorbing over Beijing. We only selected the cases when AOD at 440nm is above 0.4.
