

Supplement of

Comparison of equatorial wave activity in the tropical tropopause layer and stratosphere represented in reanalyses

Young-Ha Kim et al.

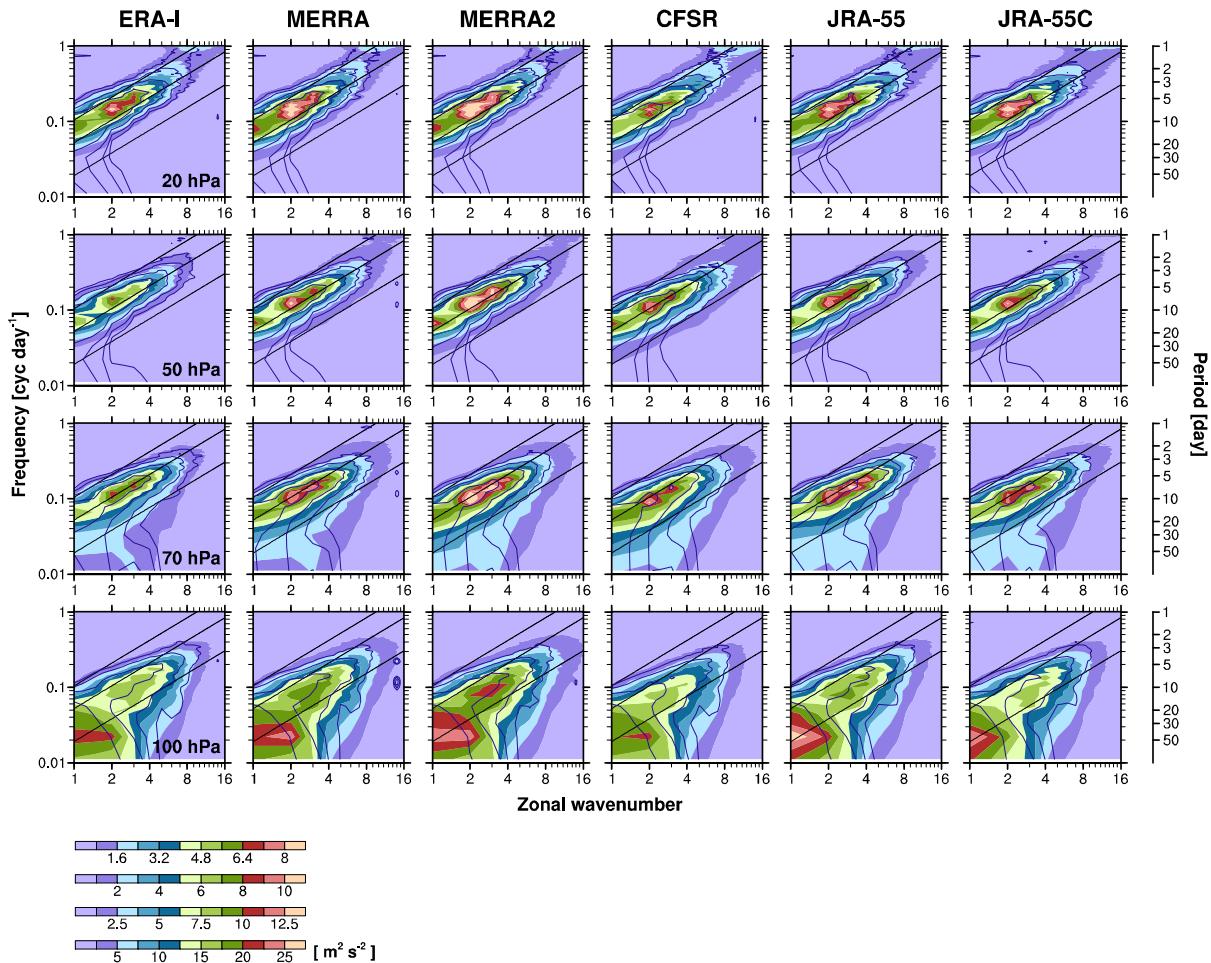

Figure S1. The same as in Fig. 1 except for the zonal wind.

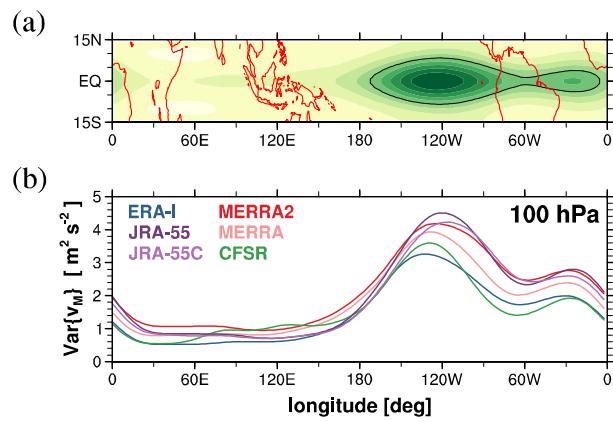

Figure S2. The same as in Fig. 3 except for the 100-hPa symmetric meridional wind filtered for $-10 \leq k < 0$ and $0.033 \leq \omega < 0.1 \text{ cyc day}^{-1}$.

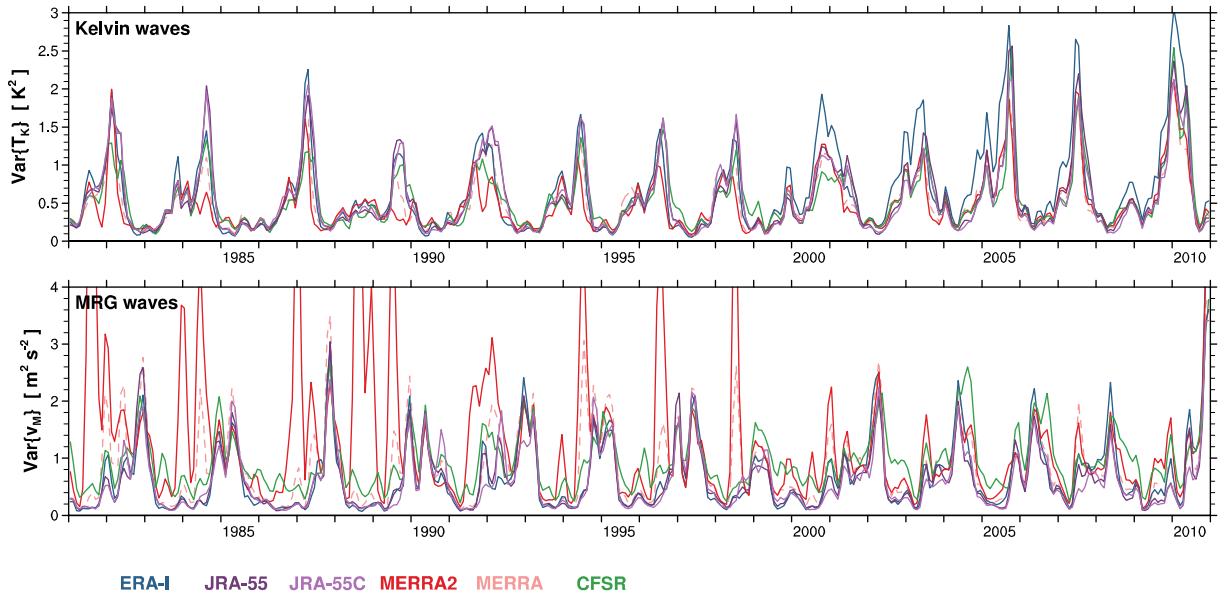

Figure S3. Monthly time series of variances of (upper) temperature for the Kelvin waves (T_{Kelvin}) and (lower) meridional wind for the MRG waves (v_{MRG}) at 10 hPa averaged over 15°N – 15°S . The MERRA results are from the standard-level datasets (dashed), and the others from the model-level datasets (solid). See the text in Section 3.1 for the definitions of T_{Kelvin} and v_{MRG} .

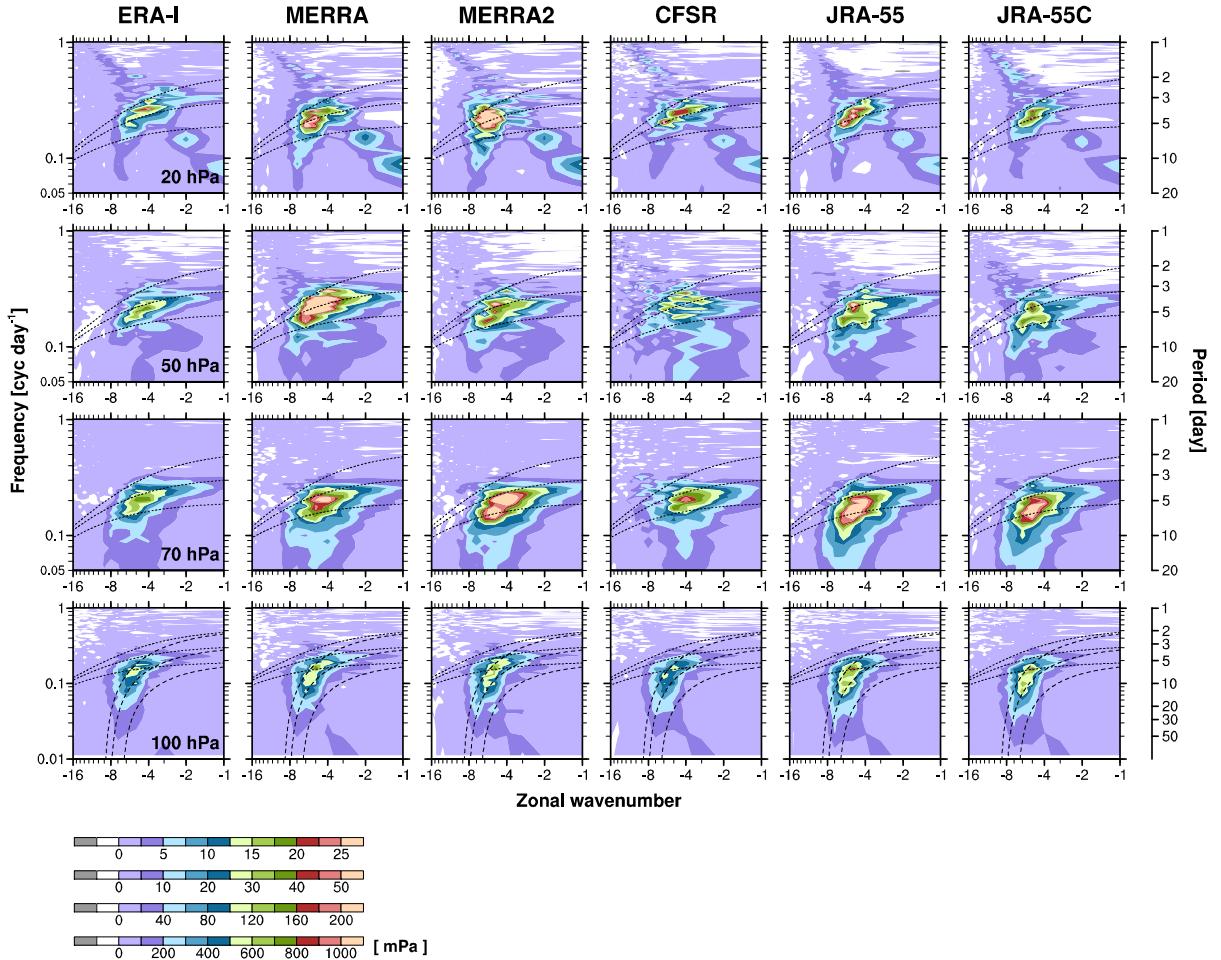

Figure S4. The same as in Fig. 10 except for $\langle F_\phi \rangle$ of antisymmetric modes over 5°N – 5°S , where $\langle F_\phi \rangle$ is the latitudinal average of the equatorward EP flux, $\text{sgn}(-\phi)F_\phi$, and ϕ the latitude.

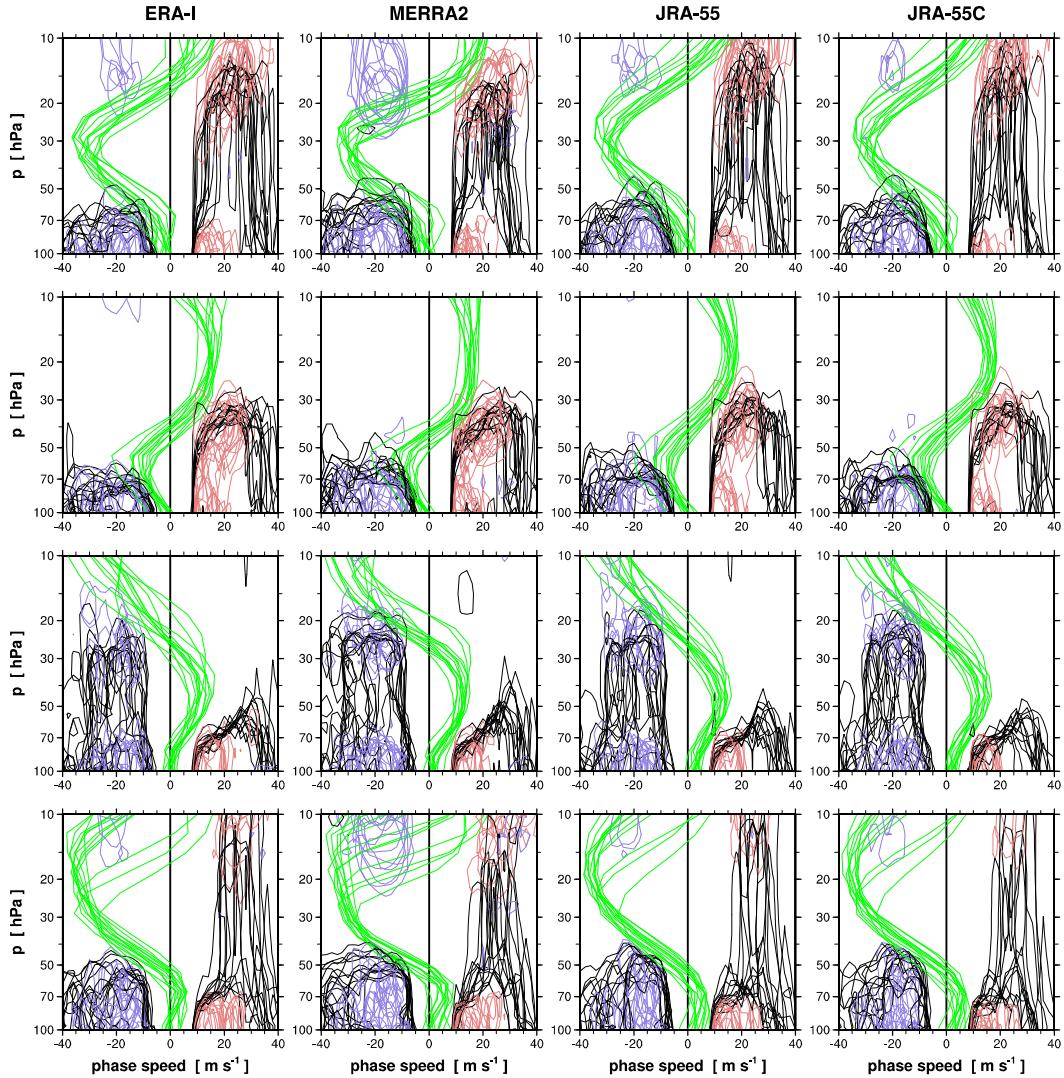

Figure S5. Spaghetti plots for 13 individual QBO cycles within the period of 1981–2010: contours for the Kelvin wave EP flux divergence of $0.3 \text{ m s}^{-1} \text{ month}^{-1} / (\text{m s}^{-1})$ (red), for the MRG wave EP flux divergence of $-0.06 \text{ m s}^{-1} \text{ month}^{-1} / (\text{m s}^{-1})$ (blue), and for the Kelvin and MRG wave F_z (black) of -0.008 and $0.0003 \text{ mPa} / (\text{m s}^{-1})$, respectively, as a function of phase speed, during the four QBO phases shown in Fig. 11 (from top to bottom). The zonal-mean zonal-wind profiles are also plotted (green).
